Bruno Di Mauro Vagenin

Technical Assessment

Product Manager

Novibet

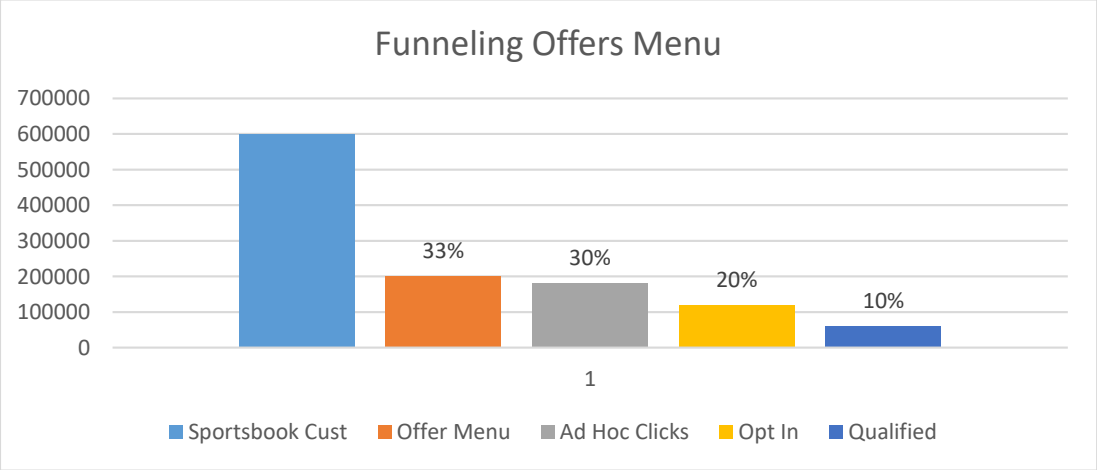
March 2026

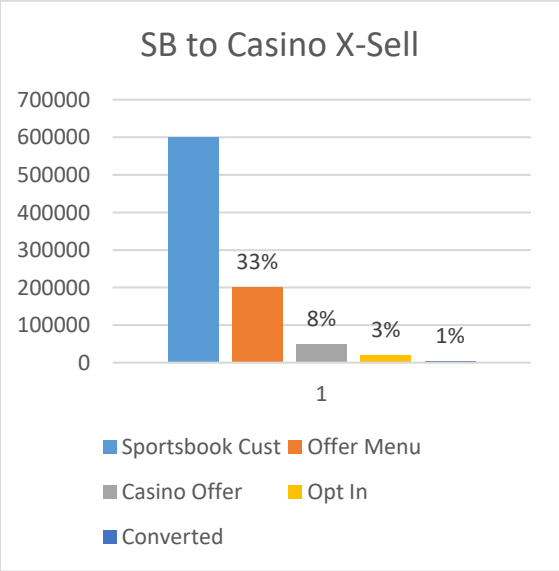
Please find below my assessment, including all my thoughts and insights on the situations presented in the attached file.

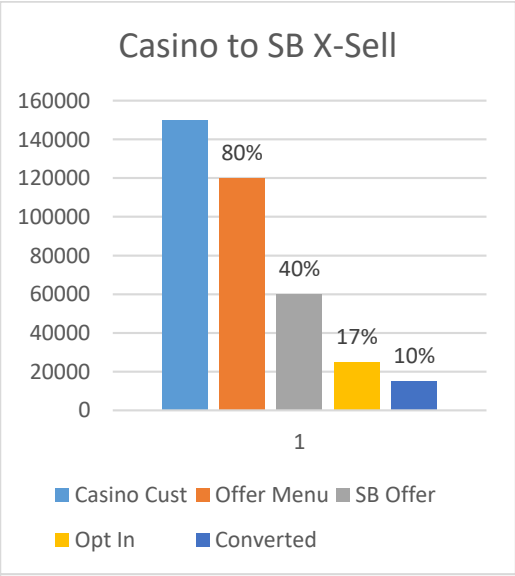
1. **Google Analytics**

Events, KPIs, Funnels – Percentage of customers clicking on the Menu and on each offer, but also how many are directed to Ad Hoc offers from the banners on the top part of the homepage. Determine Opt-ins and how many of those have actually qualified for the offers by placing necessary bets. After having enough data, we analyze it and check what has been successful or not, proposing changes or enhancing what has been done sucessfully.

We can also check Cross Sell performance with both segments being displayed with two separate menus or all together through this channel.







The main ***success*** is increasing customer retention, by giving them daily Bet & Gets, Risk Frees, and Super Boosts, however, this page also works as a Hub, centralizing and facilitating user experience by concentrating the offers in one place. It does also educates customers on fixed offers, possibly reducing contacts with support with easily founded information.

Depending on the performance of each banner, create a separate area for fixed offers and leave the menu for ad hoc (Sports & Casino) + Noviverse (personalized offers) and realize if

focusing more on these numbers could increase. It would be important also that ad hoc ones are aligned with CRM, checking the same as above, but considering as well our mailing process to customers. Another possibility could be the implementation of A/B test, providing our page with few differences and test possibilities to realize which of those turns into a better conversion of ad hoc offers.

Time spent on each session is another KPI that could be analyzed to understand how long does usually takes for customers to access the Offers Page. How long do they navigate on it and how long they stay on the offers page, understanding if customers are engaging or not with our ad hoc offers.

2. Data Analysis & Product Insights

Attached on the mail there is an Excel file with some information I have used to comment below.

Missions haven't been performing well lately for several reasons, but the main ***pain point*** observed is the decrease in conversion rate for all opt-in to completion as well as conversion for Active Users in completing their missions.

Additionally, there are other ***KPIs*** to be explored, with positive and negative impacts as below:

- June saw fewer offers than previous months in general and soccer, probably driving the drop in the numbers.
- Sudden stop on Mixed Missions in June that were constant in May, where we had better results. This would be something customers might still expect since they tend to enjoy the habit, once the offer is cut, they tend to dislike it.
- Decrease on Private offers compared to May. These offers are usually more attractive since they will reward the customer according to his Status within the company.
- Stable Active Users Opt-in percentage
- Active Users base increased, considering the jump in May compared to April, as a decrease in June is expected since normally there are fewer events available to bet.
- Increase on Active Users with 1 Opt-In at least, which is positive, however, completion went the other way around.

Possibily we might have seen harder betting requirements to release bet credits, so customers could be opting in and losing interest along the way.

Success is the increase in opt-ins/completion based on Active Users, which will lead to higher stakes and slips on the Sportsbook Missions. The higher the percentage of converted compared to active users, the better the customer experience will be on our site, and that's a natural feedback of good work.

Improvement - I presume that Missions became easier to find on the site, or the banners became more attractive and was taking more attention from the customers. Something within the UX looks like it has been done that made this navigation smoother, bringing new people to access it.

Also, since Ative Users increased, I believe again that UX improved since engagement with our missions was not the reason for the increase, as per completed mission numbers.

Once **consulted**, based on our current numbers, I would recommend a full review on the Sportsbook Missions product, starting with some questions:

- Missions - Why did we decline Missions offered in June and why did we cut Mixed Missions? Also, why did we reduce Private missions? Is this related to the fact that we have less events in June? - For these questions I would need to understand the costs of the missions, how long do they last on customers accounts and the time frame for those. Performance of Private and Mixed missions since both might be connected to a good May. I would also check if the increased offers in May had a relation to the increased numbers of Actives Users in June compared to April, even though we had less offers, analyzing the CAC of it,

- Active Users with 1 Opt-In at least – What has been done to lead to such increase? Did we release any new UX feature, did we change or add mission banners on the site? Did CRM push harder with mails/push notifications with these offers? - We need to analyze this and since we had increased interest, keep pushing for such strategy.

- Decrease on Completion across the board – If we are doing CRM communication with the offers, are we targeting the right people? Did we change something in our offer requirements? Are we targeting the right events? Are we localizing the offers and not missing any Brazilian match? Why so much Tennis in June and not much football? – All questions have to be done here to help identify why conversion rates have dropped considerably and if we have any gaps on the user journey on this area.

If I were asked to **drop Missions**, I would 100% disregard it. Currently in Brazil we do not have Opening Account Offers due to legislation, hence, keeping Missions is a must to keep aligned with main competitors. I would ask for some time to rethink the current strategy, and talking to other teams, our Product Team would come up with something new and once implemented, we would need a little more time to realize whether engagement would increase or not.

3. How to?

I would get reports with casino data from since the Casino Loyalty program was created and the same time frame before the creation of the program. On the request, I would do as below:

- Two separate reports for each period.
- Each report with weekly/monthly numbers.
- Active Casino Users
- New Sign-Ups
- Amount of players per target in both categories (Premium & VIP)
- Stakes on Casino
- GGR on Casino
- Top 50 Most played games

With the data above, I would be able to compare the Loyalty program (Casino Section) itself by period and understand if we are increasing or not in the area. I would then also be able to see numbers compared to when the program was not implemented yet and see if this implementation is seeing positive results or if we are just giving money away that could be better used.

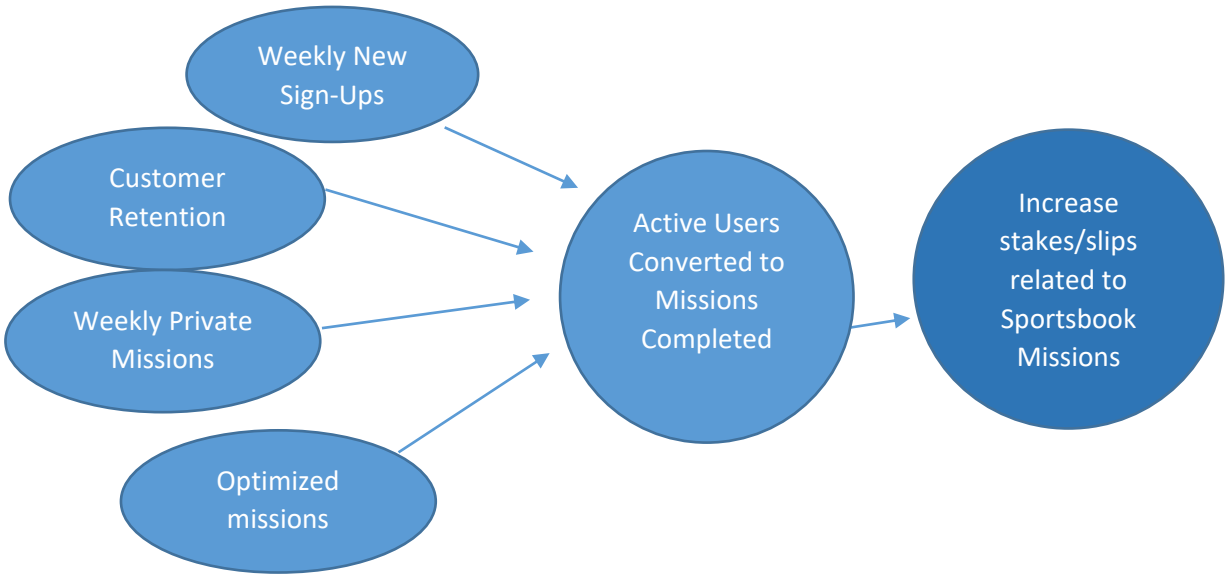
If that's the case and the program is not performing well, we could identify within the current product and restructure the requirements/criteria and prizes to maximize the offer, which has a great promotional appeal, design and perfect UX.

We could also push some games that we have a better deal with the provider and multiply (x1.5, 2.0) the points for a day/week, reason why I would ask for the rank of games as well. We could even do that at sporadic times of the day when the casino is weaker and bring customers from the Sportsbook.

Using the situation above, when we have our sportsbook customer base logged in at a busy time, we could notify them on site with push notifications promoting these games and try to convert part of the base selling them when they are already on site. I believe this could work better than sending offers via email or by just leaving the Casino offers menu, generating curiosity and selling the extra wins possibility.

4. North Star Metric Framework

Follow below my Sportsbook Mission ***North Start Metric***:



I decided to choose "***Increase stakes/slips related to Sportsbook Missions***" as the North Star Metric because that's the main goal of Sportsbook Missions. I believe we want to keep seeing these numbers increasing but always be diligent with the costs these offers might have.

If we see a constant growth in slips/stakes, it will mean that we will have more Active Users being successfully converted to our Missions and that New Sign-Ups, Retention, Tailor Made offers will be on the right process path, offering customers an efficient customer journey . Optimized missions mean that we are extremely aware of our main competitors and aiming to be among the leaders in the Market by meassuring/comparing with their offers.

Secondary metrics have been added on the map above, all being part of the product as a whole and helping to drive to our Star Metric within the Sportsbook Missions.

- **Weekly New Sign-Ups** – monitor it to understand how these can impact on the slips/stakes movement.
- **Customer Retention** – monitor customers that stay with us weekly and see how this reflects on final numbers.
- **Weekly Private Missions** – Tailoring offers based on customer segmentation (sports, stakes, bet type) to show we care individually of them.
- **Optimazed Missions** – Continuously monitor competitors to see their offers and make sure we are aligned with the main ones.

- **Active Users Converted to Missions Completed** – The most important input, is that we drive our slips/stakes increase. From all actions above, the main objective is to keep them with us and have them engaging with our offers since opening their accounts, with an user journey that understand their needs.

The NSM framework can be used to analyze in detail how to reach the Star Metric through inputs. Using it as Product Manager for Novibet, I would keep constantly monitoring the numbers on our offers along with the CRM team to make sure slips/stakes would keep increasing.

Primary inputs are key to our main goal, hence these would be constantly checked to make sure every part of the process is working towards this goal. By checking each part in detail, we can prioritize whatever is not going well across all and take actions to change whatever might be necessary along the way.

I would like to appreciate the opportunity given to show my thoughts and insights about something I love and that I really live almost 100% of my time. I tried to be as succinct as possible, and I decided to go with written PDF report rather than PowerPoint, as I believe the second option works better only for presentations.

My **approach** to each of the questions was to understand it from the product perspective, but sometimes also combine our expertise with other departments when necessary. I truly

believe that communication with other interested stakeholders is essential to the whole business success. I also like and know the importance of analyzing data to identify, diagnose, act and monitor every aspect of the customer experience (display, layouts, site ordering, positioning, localization, language, margins, offerings and more), as well as the whole customer journey (account opening process, retention, bet placement process, site delays, offers numbers and more), by being diligent with this we can be sure that product side is sharp and ready to compete on top against main competitors.

Due to limited data in some situations, I **assumed** that changes on Missions were related to UX issues or updated betting requirements/rewards, making them less attractive to customers. Also, seasonality could have played a role in June when numbers dropped across the board. Along with that, I considered CRM initiatives as an important aspect since I understand product and CRM are departments that must maintain constant communication.

Areas that could be further **explored,** I can definitely mention customer segmentation and possible costs of offers to ensure those were financially healthy. Also, A/B testing could help us validate some of the hypothesis raised during the exercise.

Looking forward to hearing from you.
